Abstract—8 Semi-synthetic derivatives of asiatic acid were prepared and their protective effect against Aβ-induced neurotoxicity was evaluated. Among them, asiatic acid (2), and 4, 16 showed 97, 92 and 87% of protective effect, respectively. © 2000 Elsevier Science Ltd. All rights reserved.

Dementia of Alzheimer’s type in the elderly has become the main social problem. Recently it has been reported that the most important pathological hallmark of Alzheimer’s disease (AD) is deposition of senile plaques in the brain. The senile plaque consists of diverse molecules but the major component is beta amyloid (Aβ) protein which is concentrated in the plaque core. Based on these results, the abnormal overproduction of Aβ has been proposed as a cause of AD.

Centella asiatica is one of the herbal plants used in different continents by diverse ancient culture and tribal groups. Historically, the extract has been used as a wound healing agent, and brain tonics for the mentally retarded. The extract has three different triterpenoid ingredients; asiaticoside (1), asiatic acid (2), and madecassic acid (3) (Fig. 1). In 1992, the extract has been patented as a dementia treating agent and cognitive enhancer. In this paper, the primary structure activity relationship (SAR) study of asiatic acid against Aβ-induced neurotoxicity were reported.

Structurally, asiatic acid (2) has three kinds of functional groups: three hydroxy groups at C(2), C(3) and C(23); an olefine group at C(12); a carboxylic acid group at C(28). Among these functional groups, the unusual triol and C(28)-carboxylic acid were modified and the protective effect against Aβ-induced neurotoxicity was evaluated.

Eight compounds were prepared from asiatic acid (2) which could be easily obtained from the titrated extract of Centella asiatica. We adapted the known procedure for the synthesis of 3,13 4,13 514 and 6,15 C(2)-Ketoasiatic acid (9) was prepared from 6 in 3 steps. The direct oxidation of 6 in the presence of C(28)-CO2H gave 9 in poor yield, but the corresponding ester (7) could be oxidized successfully. The treatment of 6 with ethoxymethyl chloride in basic condition gave 7 in poor yield, but the corresponding ester (7) could be oxidized successfully. The treatment of 6 with ethoxymethyl chloride in basic condition gave 7. The oxidation of 7 by using pyridinium chlorochromate followed by simultaneous deprotection of acetonide and ethoxymethyl ester in acidic condition gave 9. C(2)-O-Acetylasiatic acid (13) was prepared from 7 by acetylation using acetic anhydride in basic condition and the following deprotection of acetonide and ethoxymethyl ester. In case of octyloxymethyl ester of asiatic acid (11), the octyloxymethyl ester formation from 6 by using octyloxymethyl chloride followed by deprotection of acetonide in acidic condition gave 11 (Scheme 1). C(2)-Deoxyasiatic acid (16) and C(2),C(3),C(23)-tri-deoxyasiatic acid (19) were prepared from 7 and 5,
respectively as shown in Scheme 2. The treatment of 7 with CS₂, CH₃I in basic condition gave the xantate (14). The reduction of 14 with n-Bu₃SnH, followed by deprotection of acetonide gave 16. Compound 19 could be obtained by similar method. Compound 5 was converted to trixantate (17) by addition of excess CS₂ and CH₃I in basic condition. The reduction of 17, followed by hydrolysis with lithium bromide in collidine gave 19.

In order to determine the lead compound, the in vitro protective effect against Aβ-induced neurotoxicity for the above asiatic acid derivatives (4-6, 9, 11, 13, 16, 19).

Figure 1.

Scheme 1. Conditions and reagents: (a) DHP, PTSA (cat.), THF, 0 °C, 1 h, 90%, (b) Ac₂O, Et₃N, CH₂Cl₂, rt, 3 h, 90%, (c) K₂CO₃, EtOH, rt, 2 h, 85%, (d) excess CH₂N₂, 0 °C, 1 h, 100%, (e) 2,2-dimethoxy propane, PTSA (cat.), DMF, rt, 5 h, 95%, (f) EtOCH₂Cl, (i-Pr)₂NEt, CH₂Cl₂, rt, 1 h, 95%, (g) PCC, CH₂Cl₂, rt, 4 h, 82%, (h) 6 N-HCl (cat.), CH₃OH, H₂O, rt, 2 h, 85%, (i) CsH₂OCH₂Cl, (i-Pr)₂NEt, CH₂Cl₂, rt, 3 h, 85%, (j) 1 N-HCl (cat.), CH₂OH, H₂O, 0 °C, 0.5 h, 85%, (k) Ac₂O, Et₃N, CH₂Cl₂, rt, 3 h, 85%, (l) 6 N-HCl (cat.), CH₂OH, H₂O, rt, 2 h, 85%.

Scheme 2. Conditions and reagents: (a) CS₂, CH₃I, NaH, THF, rt, 2 h, 77%, (b) n-Bu₃SnH, toluene, reflux, 2 h, 85%, (c) 6 N-HCl (cat.), CH₂OH, H₂O, rt, 2 h, 85%, (d) CS₂, CH₃I, NaH, THF, rt, 2 h, 64%, (e) n-Bu₃SnH, toluene, reflux, 2 h, 82%, (f) LiBr, collidine, reflux, 3 h, 75%.
along asiaticoside (1), asiatic acid (2), and madecassic acid (3) were investigated (Table 1). Inspection of Table 1 revealed several patterns in structure versus activity. First of all, the free C(28)-CO2H derivative (2, 97%) showed higher protective activity than methyl, octyloxymethyl ester derivatives (5, 58%; 11, 22%; 1, 24%, respectively). But the tetrahydroprynyl ester derivative (4, 92%) showed comparable activity with 2 (97%). The dramatic difference between 4 and 11 which both have similar alkylloxymethyl ester group might be due to the hydrolysis of 4 inside the neuronal cell. Secondly, the triol group is very important for biological activity. This result suggested that the C(2)-OH is not quite critical but there is spatial constraint in the binding process. In case of C(3)-OH and C(23)-OH, the C(2)-deoxy derivative (16, 87%) showed decreased activity versus 2 (97%), but the C(2)-keto derivative (13, 22%) and C(2)-O-acetyl derivative (14, 50%) showed decreased activity versus 2 (97%). The additional hydroxy group at C(5) in madecassic acid (3, 56%) decreased activity. These cumulating results indicate that hydrogen bond interactions might play an important role in binding process with receptor in neuronal cell. In conclusion, SAR study was performed with semi-synthetic derivatives of asiatic acid. Among them, 2 (97%), 4 (92%) and 16 (87%) showed high protective activity against in vitro Aβ-induced neurotoxicity. This finding gives us valuable information to develop new drug for the treatment against Alzheimer’s disease. Based on the in vitro result, the further detailed SAR study and in vivo study are currently being investigated.

References and Notes

16. All new compounds gave satisfactory spectroscopic data consistent with the proposed structures.
17. The general assay method was as the following: after the pretreatment of asiatic acid derivatives (1 μM) to B103 cells for 1 h at 37 °C, cell death was induced by addition of Aβ25-35 (50 μM) to the culture for 24 h at 37 °C. MTT assay was employed to quantitify cell survival. The degree of cell survival was measured based on the absorbance at O.D. 570–630 nm, using plate reader.
